

Name	██████████
Subject/Topic	Process Knowledge in times of Big Data - From Event Logs to knowledge-intensive Processes through Process Mining
Question	Can Process Mining save as much information as manual modeled Business Processes?
Situation (known)	In Process Mining, a distinction is generally made between the data, organization and process view. While current research is focused on the process view, the data and organizational aspects have hardly been taken into account.
Complication (begs question)	It is unknown which other knowledge, available in advance, can also be used profitably in Process Mining. For example, knowledge about data, knowledge of the process itself, and the knowledge of other information related to the process.
New question (follows from complication)	How to create knowledge-intensive process models through Process Mining?
Answer (also in the top of the pyramid)	Evaluating Process Mining Models and Developing Best Practice Description for specific Event Log Requirements in order to get knowledge-intensive Process Models
